Solar Assessment Guidance -

Karthik Karuppu, Venk Sitaraman, NVICO 2019-09-12
The Earth receives 174 Petawatts (PW) of incoming solar radiation at the upper atmosphere. Approximately 30 % of its radiation is reflected back to space while the rest of 71 % (124 PW) is absorbed by clouds, oceans and land masses. The world cumulative solar PV installed capacity reached almost 398 Gigawatts (GW) in 2018. This is only about 0.3 % of solar energy utilization from the sun. There is a wide gap of utilization is noticed due to lack of technology. In 1931 selenium cell efficiency of 1% invented then in 1980 thin films cell efficiency of 6-7% introduced. After 2013, efficiency of 18 to 21% achieved by crystalline silicon technology. In India, the installed capacity of till 2018 is of 350 GW which includes renewable and non-renewable

energy sources. In that the cumulative installed solar capacity is only about 25 GW. By 2022, India wants to install 175 Gigawatt (GW) of renewable power capacity which corresponds to around half of its total electricity production. To achieve this capacity by improving solar cell efficiency from 20 % to 40 %, augmentation of grid infrastructure, massive subsidies and skilled manpower of 3 lakhs persons for the next three years to achieve the planned target. Most of the world's population lives in areas with solar insolation levels of 150 to 300 watts/m² or 3.5 to 7.0 kWh/m² per day. In India, the per capita electricity consumption from 2017 to 2018 was around 1150 to 2000 kWh. The electricity demand in the country will grow at 7 % between FY 2017 and FY 2022 and 57 % of the total electricity capacity will be generated from renewable sources by 2027 as per Central Electricity Authority (CEA). In 2011, a report by the International Energy Agency

(IEA) found that solar energy technologies such as photovoltaic, solar hot water and concentrated solar power could provide a third of the world's energy by 2060.

Applied Physics for Electronic Technology - Andrew A. Leven 1998
Increasing the awareness of the connection between physics and practical electrical problem solving is the main aim of this book. It achieves this by making the connection between fundamental physics and some of the most common practical electronic problems which engineers encounter. Other books tend to treat topics in isolation rather than compining them together in order to solve a real-life problem. Each chapter is of this unique book ends with further problems and fully worked solutions to help the student understand. The book contains seven selective topics which can be studied in isolation, such as Fibre Optic Technology and Electromagnetic Conduction. Mathematical theory is kept to a minimum; only the necessary equations required to solve the problems are presented, but each symbol presented is clearly defined. Provides both

theoretical and practical problems Includes several graded problems Suitable for foundation level students and undergraduates embarking on an electrical or electronic engineering course
