**John Dewey and the Habits of Ethical Life** - Jason Kosnoski 2010

For many years one of the most serious needs in the literary world has been for a definitive edition of the letters of Keats. Now one of the world's foremost Keats authorities, Hyder Edward Rollins of Harvard, has prepared a completely new edition of all the extant letters, with an extensive listing of the letters presumed missing. With impeccable scholarship and total faithfulness to the originals, Professor Rollins here is able to redate and rearrange sixty of the letters. Through full documentation for each letter, understanding of the content is considerably amplified both through the correction of errors, and through application of the results of the editor's life-long study of Keats and his work. In addition to many letters from Keats' relatives and friends, the present work includes seven letters or other documents signed or written by Keats that appear in no English edition, and also new texts of seven other letters by the poet. Furthermore, all the letters known only in Woodhouse's transcripts and in Jeffrey's transcripts are here printed for the first time exactly as Woodhouse and Jeffrey copied them. The letters of Joseph Severn describing the last illness and death of Keats are given in their entirety. These letters are invaluable historically and biographically, and are also exceptionally good reading.

**The Evolution of Consciousness** - Bjørn Grinde 2016-09-27

This book gives the reader an understanding of what consciousness is about, and of how to make conscious experiences more pleasant. It expands on a new theory that describes the evolutionary trajectory leading to conscious life forms. In short, the evidence suggests that consciousness first evolved some 300 million years ago as a consequence of the introduction of feelings. Feelings offer a strategy for making behavioural decisions. Besides playing a crucial role in the evolution of the human mind, they are a key factor in regard to mental health and quality of life. Fortunately, the human brain is plastic. By exploiting available options for modulating the mind, it is therefore possible to impact on what sort of experiences the brain serves. More specifically, you can strengthen the capacity for positive feelings and reduce the sway of negative feelings. The text covers biological, neurological, psychological, and philosophical aspects of the mind.

**Consensus on Peirce's Concept of Habit** - Donna E. West 2016-09-12

This book constitutes the first treatment of C. S. Peirce's unique concept of habit. Habit animated the pragmatists of the 19th and early 20th centuries, who picked up the baton from classical scholars, principally Aristotle. Most prominent among the pragmatists thereafter is Charles Sanders Peirce. In our vernacular, habit connotes a pattern of conduct. Nonetheless, Peirce's concept transcends application to mere regularity or to human conduct; it extends into natural and social phenomena, making cohesive inner and outer worlds. Chapters in this anthology define and amplify Peircean habit; as such, they highlight the dialectic between doubt and belief. Doubt destabilizes habit, leaving open the possibility for new beliefs in the form of habit-change; and without habit-change, the regularity would fall short of habit - conforming to automatic/mechanistic systems. This treatment of habit showcases how, through human agency, innovative regularities of behavior and thought advance the process of making the unconscious conscious. The latter materializes when affordances (invariant habits of physical phenomena) form the basis for modifications in action schemas and modes of reasoning. Further, the book charts how indexical signs in language and action are pivotal in establishing attentional patterns; and how these habits accommodate novel orientations within event templates. It is intended for those interested in Peirce's metaphysics or semiotics, including both senior scholars and students of philosophy and religion, psychology, sociology and anthropology, as well as mathematics, and the natural sciences.

**John Dewey's Concept of Habit and the Dynamics of Growth** - William Earl Brownson 1970

**Rhetoric, Modality, Modernity** - Nancy S. Struever 2009-11-15

Since antiquity, philosophy and rhetoric have traditionally been cast as rivals, with the former often lauded as a search for logical truth and the latter usually disparaged as empty speech. But in this erudite intellectual history, Nancy S. Struever stakes out a claim for rhetoric as the more productive form of inquiry. Struever views rhetoric through the lens of modality, arguing that rhetoric's guiding interest in what is possible—as opposed to philosophy's concern with what is necessary—makes it an ideal tool for understanding politics. Innovative readings of Hobbes and Vico allow her to reexamine rhetoric's role in the history of modernity and to make fascinating connections between thinkers from the classical, early modern, and modern periods. From there she turns to Walter Benjamin, reclaiming him as an exemplar of modernist rhetoric and a central figure in the long history of the form. Persuasive and perceptive, *Rhetoric, Modality, Modernity* is a novel rewriting of the history of rhetoric and a heady examination of the motives, issues, and flaws of contemporary inquiry.

**Habits: plasticity, learning and freedom** - Javier Bernacer 2015-11-05

In present times, certain fields of science are becoming aware of the necessity to go beyond a restrictive specialization, and establish an open dialogue with other disciplines. Such is the case of the approach that neuroscience and philosophy are performing in the last decade. However, this increasing interest in a multidisciplinary perspective should not be understood, in our opinion, as a new phenomenon, but

rather as a return to a classical standpoint: a proper understanding of human features—organic, cognitive, volitional, motor or behavioral, for example—requires a context that includes the global dimension of the human being. We believe that grand neuroscientific conclusions about the mind should take into account what philosophical reflection has said about it; likewise, philosophers should consider the organic constitution of the brain to draw inferences about the mind. Thus, both neuroscience and philosophy would benefit from each other's achievements through a fruitful dialogue. One of the main problems a multidisciplinary group encounters is terminology: the same term has a different scope in various fields, sometimes even contradictory. Such is the case of habits: from a neuroscientific perspective, a habit is a mere automation of an action. It is, therefore, linked to rigidity and limitation. However, from a classical philosophical account, a habit is an enabling capacity acquired through practice, which facilitates, improves and reinforces the performance of certain kind of actions. From neuroscience, habit acquisition restricts a subject's action to the learnt habit; from philosophy, habit acquisition allows the subject to set a distance from the simple motor performance to cognitively enrich the action. For example, playing piano is a technical habit; considering the neuroscientific account, a pianist would just play those sequences of keystrokes that had been repeatedly practiced in the past. However, according to the philosophical perspective, it would allow the pianist to improvise and, moreover, go beyond the movements of their hands to concentrate in other features of musical interpretation. In other words, a holistic view of habits focuses on the subject's disposition when facing both known and novel situations. We believe neuroscience could contribute to achieve a deeper understanding of the neural bases of habits, whose complexity could be deciphered by a philosophical reflection. Thus, we propose this Research Topic to increase our understanding on habits from a wide point of view. This collection of new experimental research, empirical and theoretical reviews, general commentaries and opinion articles covers the following subjects: habit learning; implicit memory; computational and complex dynamical accounts of habit formation; practical, cognitive, perceptual and motor habits; early learning; intentionality; consciousness in habits performance; neurological and psychiatric disorders related to habits, such as obsessive-compulsive disorder, stereotypies or addiction; habits as enabling or limiting capacities for the agent

**Silence** - Maria-Luisa Achino-Loeb 2005-12-30

This book is about silence and power and how they interact. It argues that only by studying how silence works-how it is implicated in the construction of meaning-can we arrive at the elusive roots of power in all its dimensions. Silence becomes the currency of power by delineating the margins or what we perceive and through a sleight of hand wherein behaviors undertaken in the service of self-interest appear instead as inevitable and devoid of human agency. The theoretical load of this argument is carried by vivid ethnographic material dealing with music, linguistic behavior, racial conflicts, work dislocations, and the construction of anthropological subjects and texts.

*Semiotic Subjectivity in Education and Counseling* - Inna R. Semetsky 2019-10-16

*Semiotic Subjectivity in Education and Counseling* demonstrates the importance of addressing the concept of the unconscious in learning. Exploring the innovative concept of edusemiotics, it challenges the received notion of learning as solely academic and linguistic, instead offering an ethico-aesthetic paradigm that draws on transdisciplinary research in the context of this new direction in educational theory. The chapters explore the production of subjectivity within the process of semiosis as the action and transformation of signs. An unorthodox pedagogy of the unconscious blends with the therapeutic dimension and produces subjectivities that emerge in the midst of the relational dynamics of experience. The book argues for holistic education that rejects the schism between matter and spirit pervading Western thinking and represents a shift in rethinking spirituality while never separating it from logic and reason. Giving voice to the unconscious contributes to learning and changing our habits as an important objective in educative and counseling practices. The book critically examines the legacy of Charles S. Peirce, Lev S. Vygotsky and other forerunners of edusemiotics. It will be essential reading for academics, researchers and postgraduate students across the fields of educational philosophy, educational psychology and counseling as well as science studies.

Forgotten Ideas, Neglected Pioneers - Daniel L. Schacter 2012-12-06

Richard Semon was a German evolutionary biologist who wrote, during the first decade of the twentieth century, two fascinating analyses of the workings of human memory which were ahead of their time. Although these have been virtually unknown to modern researchers, Semon's work has been rediscovered during the past two decades and has begun to have an influence on the field. This book not only examines Semon's contribution to memory research, but also tells the story of an extraordinary life set against the background of a turbulent period in European history and major developments in science and evolutionary theory. The resulting book is an engaging blend of biographical, historical and psychological material.

**The Economics of Climate Change and the Change of Climate in Economics** - Kevin Maréchal 2013-05-02

Climate change is without question the single most important issue the world faces over the next hundred years. The most recent scientific data have led to the conclusion that the globally averaged net effect of human activities since 1750 has been one of warming and that continued greenhouse gas emissions at or above current rates would cause this process to continue to the severe detriment of our environment. This unequivocal link between climate change and human activity requires an urgent, world-wide shift towards a low carbon economy and coordinated policies and measures to manage this transition. The starting point and core idea of this book is the long-held observation that the threat of climate change calls for a change of climate in economics. Inherent characteristics of the climate problem including complexity, irreversibility and deep uncertainty challenge core economic assumptions and mainstream economic theory appears inappropriately equipped to deal with this crucial issue. Kevin Maréchal shows how themes and approaches from evolutionary and ecological economics can be united to provide a theoretical framework that is better suited to tackle the problem.
