The Behaviour and Design of Steel Structures to EC3 - N.S. Trahair 2017-12-21

The fully revised fourth edition of this successful textbook fills a void which will arise when British designers start using the European steel code EC3 instead of the current steel code BS5950. The principal feature of the forth edition is the discussion of the behaviour of steel structures and the criteria used in design according to the British version of EC3. Thus it serves to bridge the gap which too often occurs when attention is concentrated on methods of analysis and the sizing of structural components. Because emphasis is placed on the development of an understanding of behaviour, many analytical details are either omitted in favour of more descriptive explanations, or are relegated to appendices. The many worked examples both illustrate the behaviour of steel structures and exemplify details of the design process. The Behaviour and Design of Steel Structures to EC3 is a key text for senior undergraduate and graduate students, and an essential reference tool for practising structural engineers in the UK and other countries.

The Any Person Mindset - Dan Coughlin
2020-08-10

All employees from those in the executive suite to the front line are accountable to themselves for their results, behaviors, and relationships.

Toss out the 80/20 mentality, where 20% of the people produce 80% of the results. This archaic approach has created both massive employee disengagement and entitlement. To thrive in business today, you need the 80 + 20 mindset, where 100% of the results are produced by 100% of the employees. This is a book about optimizing your performance, and the performance of your employees. The Any Person Mindset says any person can make a significant difference in an organization, but no one is born with the necessary traits. These are learned thinking traits. It takes intentional focus and effort to make the impact you are capable of making. This book is a map and Dan Coughlin and Lee Renz are your guides for making the difference you can make in your work. On this journey you will clarify your purpose at work and the career you want, understand your Assets for Significance and how to apply them, consider how you think and the impact on your emotions, see the Assets for Significance in other people, and focus on building effective teams and leading them to sustainable improvement in key results.

Earthquake Engineering for Structural Design - Victor Gioncu 2014-04-21

Developments in Earthquake Engineering have focussed on the capacity and response of structures. They often overlook the importance of seismological knowledge to earthquake-proofing of design. It is not enough only to understand the anatomy of the structure, you must also appreciate the nature of the likely

earthquake. Seismic design, as detailed in this book, is the bringing together of Earthquake Engineering and Engineering Seismology. It focuses on the seismological aspects of design – analyzing various types of earthquake and how they affect structures differently. Understanding the distinction between these earthquake types and their different impacts on buildings can make the difference between whether a building stands or falls, or at least to how much it costs to repair. Covering the basis and basics of the major international codes, this is the essential guide for professionals working on structures in earthquake zones around the world.

Design of Steel Structures - Elias G. Abu-Saba 2012-12-06

This book is intended for classroom teaching in architectural and civil engineering at the graduate and undergraduate levels. Although it has been developed from lecture notes given in structural steel design, it can be useful to practicing engineers. Many of the examples presented in this book are drawn from the field of design of structures. Design of Steel Structures can be used for one or two semesters of three hours each on the undergraduate level. For a two-semester curriculum, Chapters 1 through 8 can be used during the first semester. Heavy emphasis should be placed on Chapters 1 through 5, giving the student a brief exposure to the consideration of wind and earthquakes in the design of buildings. With the new federal requirements vis a vis wind and earthquake hazards, it is beneficial to the student to have some understanding of the underlying concepts in this field. In addition to the class lectures, the instructor should require the student to submit a term project that includes the complete structural design of a multi-story building using standard design procedures as specified by AISC Specifications. Thus, the use of the AISC Steel Construction Manual is a must in teaching this course. In the second semester, Chapters 9 through 13 should be covered. At the undergraduate level, Chapters 11 through 13

should be used on a limited basis, leaving the student more time to concentrate on composite construction and built-up girders.
